Using Assistive Touch on iOS Devices
Save on the physical use of the Home button

Operate any iOS device (5 or higher) without using the Home button or the On/Off/Sleep/Wake button by enabling *AssistiveTouch*. Tap **Settings** > **General** > **Accessibility** > **AssistiveTouch**. Turn **AssistiveTouch** ON.

The icon below will appear in the right corner of the Home screen once *AssistiveTouch* is enabled. It can be dragged to any point along the bottom or sides of the device screen.

Navigation is performed by tapping on the *AssistiveTouch* icon which then displays four images on the *AssistiveTouch* menu. Each image represents a gesture that must otherwise be physically performed on the device.

Single or double-tapping the **Home button** on the *AssistiveTouch* menu simulates pressing the actual Home button on the iOS device.

Tapping **Device** on the *AssistiveTouch* menu also simulates the use of power or volume buttons on the iOS device as shown below.
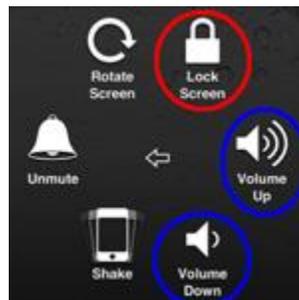

Lock Screen can be used for Sleep Mode or to power down. Tap once for sleep mode – press and hold for 3-5 seconds until Slide to Power Off slider appears for powering down.

Tapping **Volume Up** or **Volume Down** on the AssistiveTouch menu may be faster and easier than using the physical volume controls on the side or the multi-tasking menu.

Tapping the **Back arrow** or **left arrow** in the center returns to the previous menu.
